

DESCRIPTION

Xstream SAFE is a Mass Notification/Communication Management software tool that allows a community, municipality, county or state agency the ability to communicate effectively with administrative groups, emergency personnel, first responders, and ultimately the public at large in the event of potential or actual emergencies. This is accomplished via text messaging to existing cell phones, PDA's, alphanumeric pagers, email, etc. XSM uses cellular technology rather than outdated landline technology. Landline communication is neither a reliable nor time-sensitive method of alerting people in emergency situations and auto-dialers (required for landline communication) are not a cost-effective means of notification. Xstream Mobile Solutions feels that cellular text messaging is the most efficient method to deliver these messages, as the vast majority of people carry their cell phones with them.

TEXT MESSAGING BENEFITS

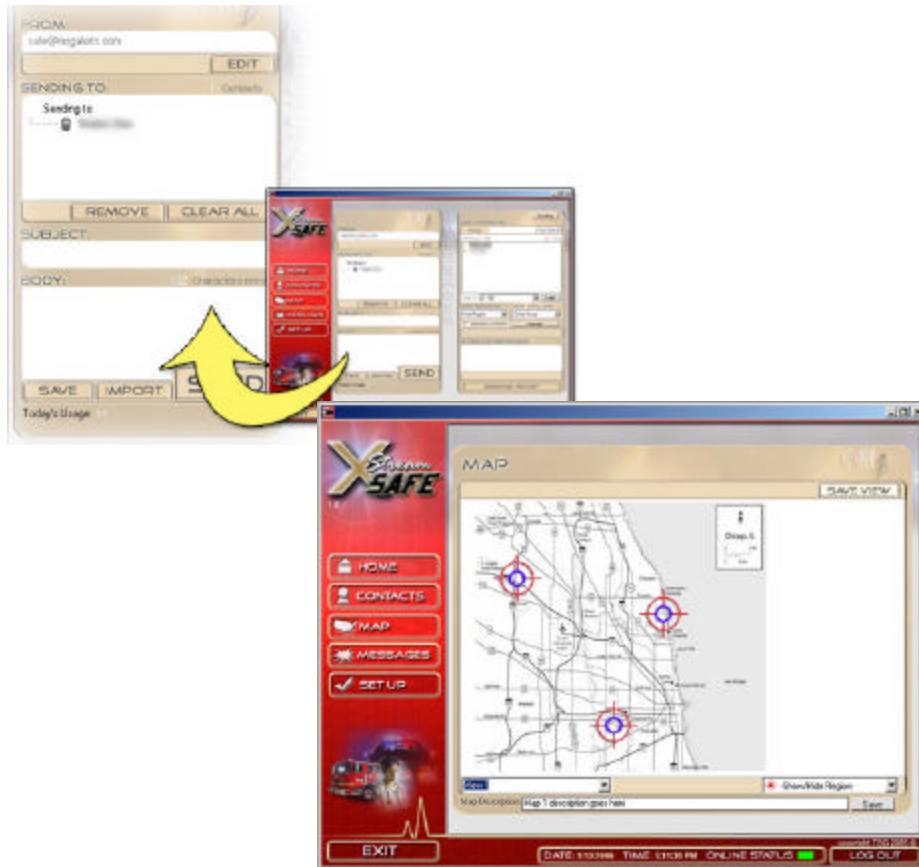

Text Messaging has been proven to be the most reliable form of communication in a truly "dark" environment. We all remember people trying to call on their cell phones

FEATURES

- **DBM-1**: Database Migration Software that creates databases automatically for your organization. Individuals go to a website link from your webpage, test their phone and select the alerts of which they choose to be notified. The program then puts them into the specific group(s) for retrieval at the required time. Group determination is completely customizable to your specifications.
- **Mapping**: Customizable to your environment. This could be a map of your town or county, the rail area of your community, potential HAZMAT areas, and even specific buildings.
- **Import/Export**: Ability to import and export existing contact databases, if needed.
- **Archive of sent messages**: Every message sent including day, time and body of message.
- **Two methods of Delivery**: Send Text, Email or both simultaneously.
- **WAP** (Wireless Application Protocol) capable: Send messages from cell phones that are Internet accessible. You don't necessarily need a computer to send messages.
- **Message Storage**: Store messages for easy retrieval when seconds count.
- **Both Client-Side and Server-Side Capabilities**: This means that sensitive personal data is stored on your server, not a server in another state or country. You protect your community from the inside out, meaning whenever possible, you rely on your own efforts to provide safety and security for your residents. Citizens are comfortable knowing you are protecting their personal information.
- **Certification Indicator**: Lets you know that people in groups have tested and registered their phones.
- **Contact Size**: Scalable from small groups of 1-100 up to potentially tens of thousands .

APPLICATIONS

Severe Weather: <ul style="list-style-type: none">• Tornado• Floods• Mudslides• Avalanche• Wildfires• Snowstorms• Levee Breaks	Police: <ul style="list-style-type: none">• Amber Alert• Prisoner Escape• Bomb Threat• Crime Watch• Predator Alert• Evacuation Notice/Route	Public Works: <ul style="list-style-type: none">• Boil Orders• Gas Leaks• Utility Outages• Road Hazmat: <ul style="list-style-type: none">• Nuclear• Bioterrorism• Chemical

Disclaimer:

Text communication is not flawless as there are many components that go into successful messaging. These components include but are not limited to Internet capability, signal strength, structures, buildings, topography, geography, server robustness, provider network integrity, etc. Any of these may impact the quality of service and deliverability. While no system can ensure 100% delivery, XSM SAFE offers the fastest and most reliable method available.

Xstream Safe Requirements:

Internet Connection (high-speed recommended)
Internet Explorer 6.0 or higher
Windows XP or 2000
Pentium 3 or higher
500 MHz or higher
50 Megabytes (minimum) Hard Drive Space
128 MB RAM
CD-Rom Drive
800 x 600 Screen Resolution
